

sliding

Slide Ht: 1.17m

The slide offers that most sought after experience in play areas: sliding from height. The grip bar at the top of the slide is there to help avoid unintentional starts and to assist with correct pre-slide positioning. The all stainless steel one-piece design of this slide makes it wear-free. Height 1.17m: for discovering those first thrills.

balancing

Balance Beam

The balance beam is relatively short and close to the ground. Users move forward on a slightly raised element. The rounded shape makes it slightly more challenging. The beam gives very young children an opportunity to improve their balance skills and train themselves. It requires concentration and body control.

Japanese steps

Stepping stones help develop balance and coordination. Children move along on separate, slightly raised elements of varying heights (20cm / 30cm / 40cm). The relatively low height and wide diameter of the logs make this crossing activity accessible to a wide age range.

balancing

■ Rope walkway

The rope walkway tests children's balance skills as they move on ropes that are by nature unstable. Children grasp the upper log to keep their balance. Successive ropes are positioned increasingly high. Moving on the walkway and the final transfer to the platform require good coordination and a good understanding of height and empty space by children.

climbing

■ Vertical net

The vertical net can be used for moving between two platforms. Fairly low, with a square, regular mesh, this net is relatively easy to cross. On the net, children learn how to use footholds and handholds in a coordinated way and progressively improve their management of the sensations of height, empty space and imbalance.

meeting / role play

■ Roof

Firmly anchored to robinia wood posts, this triangular roof is made of larch half-logs which add volume to the play structure. The geometric shape also gives it a contemporary look. Its primary function is to offer protection against rain and sun.

■ Platform Ht: 1.37m

A triangular-shaped tower enables optimal distribution of play activities. The height of 1.37m is a significant height for more seasoned climbers with off-ground access points and exits. The robinia wood posts are exceptionally resistant. The floor is made of anti-slip compact for maximum safety.
